11. Density and abundance index by stratum	12.
12. Estimated biomass (t) by species.....	13.
13. Maximum, minimum and modal lengths of selected fish species	16.

List of figures

1. Map depicting Trawling stations in the Gambian waters	7.
2. Total catches (kilograms) by stratum	9.
3. Estimated biomass (%) by stratum	12.
4. Estimated biomass (t) by stratum.....	13.

Annexes

1. The Trawl design	19.
2. Fish species and families caught during the cruise	20.
3. Length measurements of the selected fish species	22.
4. Total catch at each trawl station (kg), number and estimated biomass (t)	25.
5. Important fish species of commercial value, catch and % catch.....	31.
6. Catches of fish species (kg) by station and total.....	31.

1.0. Introduction

1.1. Background

The West African Economic Monitoring Union (WAEMU) among its programmes commenced implementation of a five year Programme for development of the Fisheries Sector within the framework of its Agricultural Policy. These programmes included fisheries surveys and analysis of the demersal and pelagic fish resources within the participating coastal countries in the sub-region. The idea is to have information and knowledge of the fish stocks in order to assist the Government to manage their fisheries resources.

The Regional Project for Evaluation of the Fish Stocks is aimed to improve and strengthen the knowledge-base of the participating coastal states. The regional survey was divided into two (Demersal Trawl Survey and Pelagic Trawl Survey) based on the request of the participating countries. The Demersal Trawl Survey was successfully conducted in all the countries of the North except in the waters of Guinea Bissau. The Demersal Trawl Survey was executed by the *Centre National des Sciences Halieutiques de Boussoura (CNSHB)* with its research vessel - *Général Lansana Conté* (R/V GLC).

This report is specifically concerned with the Demersal Trawl Survey conducted in the Gambian waters by the GLC, on 21st May, 2012. The report is prepared by Messrs Ebou Mass Mbye and Saloum Jatta, both Focal Points of the UEMOA Project, The Gambia.

2.0: Objectives of the Demersal Trawl Survey

2.1. The main objective:

The main objective of the Demersal Trawl Survey was to have information on the fish stocks in the waters of The Gambia with specific objectives as follows:

- To obtain relative abundance indices of the selected demersal commercial species.
- To have knowledge of the fish and bathymetrical distribution of the main fish species.
- To have knowledge of the fish size (length of fish) of the main fish species.

3.0: Materials and methods.

3.1. Materials

3.1.1. Characteristics of the GLC (survey vessel).

The R/O GLC is a fisheries research vessel managed by the CNSHB (*Centre National des Sciences Halieutiques de Boussoura*). Its specifications are provided in Table 1.

Table 1. Characteristics of GLC.

No.	Characteristics	Size.
1.	Length	29.93 m.
2.	Depth	7.30 m.
3.	Width	2.60 m.
4.	Engine Horse power	750 HP.
5.	Gross Registered Tonnage (GRT)	198 Mt.
6.	Maximum speed	10.0 knots.
7.	Trawling speed	4.0 knots

3.1.2. The Trawl gear

The fishing gear used in the survey is a six (6) Seam Semi-balloon Trawl. The netting material is *Polyethylene*. The net consists of several panels. Mesh depth varies. Stretched mesh sizes from wing tips to the last belly is 75.0 mm, decreasing to 25.0 mm. at cod-end. The ground gear consists of rubber and bobbin. The specification of the trawl gear is presented in Table 2.

Table 2. Specifications of the trawl gear.

No.	Specification	Size
1.	Total length of the trawl net	39.85 m
3.	Stretched Mesh size at Cod-end	25.0 mm
4.	Stretched Mesh size at bellies and wings	75.0 mm
5.	Warps (Bobbin & iron)	80.0 & 120.0 mm dia.
6.	Weight of net in the water	220.0 kg
7.	Weight of otter boards at sea	450.0 kg

3.1.3. The scientific materials.

The scientific materials used during the trawl survey are presented in Table 3 below.

Table 3. The scientific materials.

No.	Material	Purpose	Size
1.	Marel M1100e electronic scale.	To measure (weigh) baskets of fish species	60.0 kg.
2.	Spring hand scale.	To measure individual fish species	50.0 kg.
3.	Fish measuring boards (Ichtyometer)	To measure fish length	50.0 & 60.0 cm
4.	Computer	Entry of the trawl data, biology and oceanography	
		Data analysis & report writing.	
5.	Catalogue (book) of fish species	Identification of fish species	

3.2: Survey Sampling Plan

Based on the continental self of The Gambia, six (6) stations were allocated to The Gambia during the UEMOA Togo meeting 2011. The Gambia opted for three strata with a maximum of two stations per stratum. These strata and the number of stations are as follows:

1. 010 - 050m = 2 stations.
2. 051 - 100m = 2 stations.
3. 101 - 200m = 2 stations

3.3: Itinerary of GLC at the Gambian coast.

The GLC arrived at the Port of Banjul on 20th May, 2012, at about mid-day, only to disembark the two Senegalese Scientists. Two other Gambian fisheries personnel embarked to the vessel the same day to participate in the demersal survey in the Gambian waters. The Gambian participants were as follows:

- Mr. Saloum Jatta, Fisheries Officer.
- Mr. Salifu Ceesay, Fisheries Assistant.

The GLC left the Port of Banjul on the 20th May, 2012, at about 19:00, for the Atlantic Coast (Marine waters) of The Gambia, to commence the UEMOA funded demersal trawl survey. The vessel returned to the Port of Banjul early morning of the 22nd May, 2012, to disembark the two Gambian participants and sailed the same day at around 16:00 to the coast of Guinea.

It should be noted that Mr. Ebou Mass Mbye was participating in the Ecosystem Survey of the CCLME, onboard the R/V. Dr. Fridtjof Nansen, in the waters of Guinea to Central Dakar, during the time of the Demersal Trawl Survey, funded by the UEMOA Project.

3.4: The Demersal Trawl Survey.

The Demersal Trawl Survey conducted in the Gambian waters took place on the 21st May, 2012 (one day). Trawling was conducted at six (6) Trawl Stations (57, 58, 59, 60, 61 & 62) from 08:23 to 18:15 (during the day) (Fig. 1).

3.5: Data collection.

In all fisheries surveys it is required to list down the necessary data before the actual survey commenced. In this survey three categories of data were collected:

- **Biological data:** family and taxonomic name of each species, weight and number of each category of fish species; length measurements of ten selected fish species.
- **Spatial and temporal data:** trawling positions (Latitudes / longitudes), trawling time (Start and end in minutes), dates, bathymetric depths and stratum.
- **Environmental data:** bottom and surface water temperature in °C.

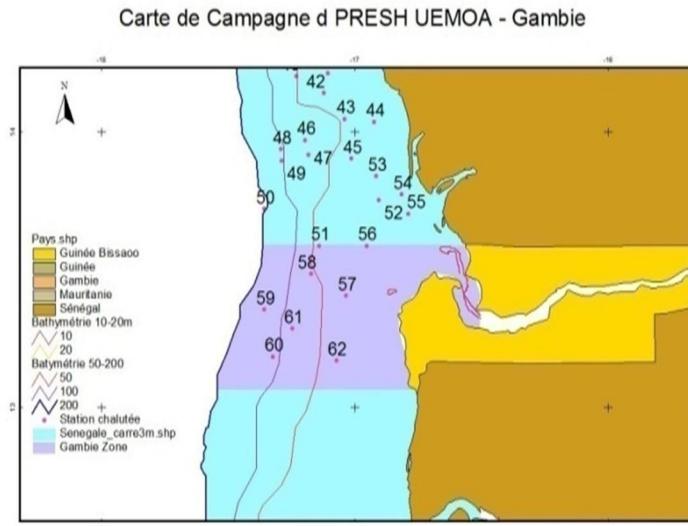

Fig. 1. Map depicting Trawling stations in the Gambian waters.

3.6: Data processing:

The trawl data are stored in Excel. The sums were calculated using a hand-held calculator. The specific biomass of individual fish species were also calculated based on the strata and the trawl stations. The total biomass is the sum of the six stations. The method used in the calculation of biomass is provided in 3.6.1.

3.6.1. Method of Biomass estimation.

- Calculation of the distance covered by the vessel (D), is translated to the formula below:

$$\triangleright \quad D = S * T.$$

- ✓ Where: D = Distance covered by the vessel in Nautical miles.
- ✓ S = Speed of the vessel (knots).
- ✓ T = Time taken for a Trawl.

The formula used to estimate biomass is as follows:

- $C/a * A$ (Catch (kg)/surface area (km^2) * Area of the stratum. This indicates that C = Catch, a = area covered and A = Coverage area of the stratum (Reference) from previous surveys.
- Abundance indices:
 - C/t . This implies that C = Catch (kg) and t = time (hr).
- Density:

➤ **C/a**

This implies that C = Catch (kg).

a = area covered.

4.0: Results

4.1. Hydrography (Sea water temperature).

Table 4 represents the Temperature of the bottom and the surface of the sea. The water samples were tested and temperature recorded at all the six trawl stations by a thermometer onboard. The average surface temperature was relatively cold (25.5°C), whiles average temperature at the bottom was colder (18.8°C). Surface temperature close to the shores (Station 62) was warmer compared to stations 57, 58, 59, 60 and 61.

Table 4. Average bottom and surface temperatures of the 6 trawled stations.

No.	Station No.	Stratum (m)	Fishing depth (m)	Bottom Temperature (°C)	Surface Temperature (°C)
1.	57	010.0 – 050.0	21.0	19.5	25.13
2.	58	051.0 – 100.0	52.0	18.7	24.93
3.	59	101.0 – 200.0	110.0	18.4	25.04
4.	60	101.0 – 200.0	105.0	18.4	25.79
5.	61	051.0 – 100.0	43.0	18.9	25.76
6.	62	010.0 – 050.0	22.0	18.6	26.20

4.2. Coverage Area.

The total coverage area of the three bathymetric strata (010-050 m, 051-100 m & 101-200 m) is 0.30655 km² (Table 5).

Table 5. Coverage area (km²) by strata.

Country	010-050m	051-100m	101-200m	Total
The Gambia, GLC (Coverage Area in km ²)	0.10267	0.10267	0.10121	0.30655
Coverage Area from previous surveys	2514.00	1341.00	161.00	4016.00

The survey was divided into three strata that are determined by the bathymetric depths. The six (6) trawl stations (57 – 62) were conducted in three (3) strata and each stratum has two (2) stations based on the bathymetric depths (Table 6).

Table 6. Bathymetric depths, coverage area and catches

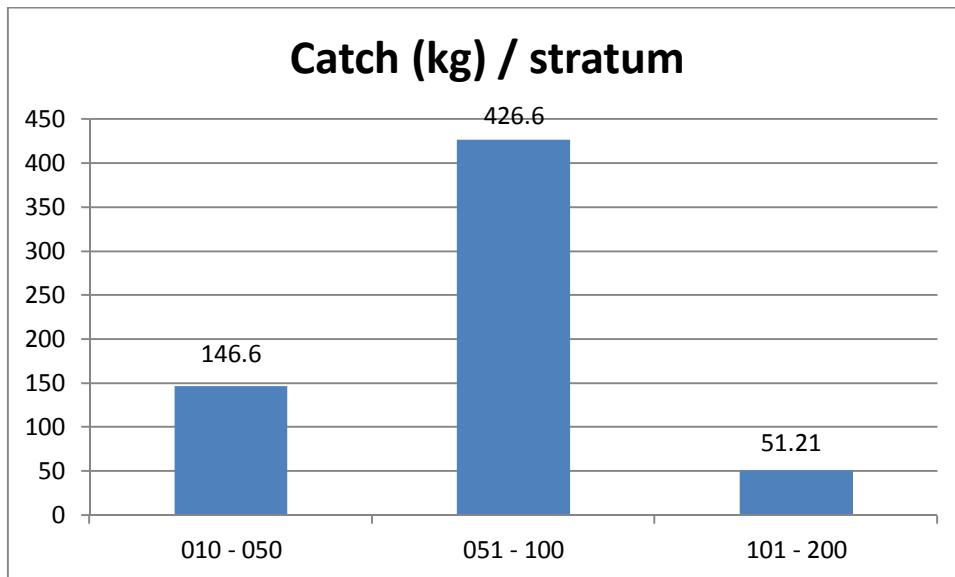

No.	Station No.	Stratum (m)	Coverage area (km ²).	Trawling depth (m)	Catches (kg)
1.	57 & 62	010 – 050	0.10267	21.0 – 26.0	146.60
2.	58 & 61	050 – 100	0.10267	75.0 – 48.0	426.60
3.	59 & 60	101 – 200	0.10121	98.0 – 112.0	51.21
Total coverage			0.30655		624.41

4.3. Fish species caught.

A total of sixty-six (66) fish species from forty-one (41) families were sampled in the Gambian waters (Annex 2). Based on the stratum, more fishes were caught within the 051 - 100m stratum (60.28 %) as compared to the 010 - 050m stratum that represented 38.84 % of the catches and 101 – 200m stratum representing only 0.88 % of the catches (Fig. 2). This means that the 051 - 100m stratum is found to be more productive during the survey than the others.

Table 7. Catches by trawl station/ stratum

No.	Station No.	Strata	Catches (kgs)	Catch/min
1.	57	010 – 050	9.20	0.31
2.	58	051 – 100	105.15	3.51
3.	59	101 – 200	35.12	1.17
4.	60	101 – 200	16.09	0.54
5.	61	051 – 100	321.45	10.72
6.	62	010 – 050	137.40	4.58

**Fig. 2.** Total catch (kg) by stratum.

4.4. Specific catches (kg) and abundances (kg/h) of some fish families (Table 8, Table 9).

4.5. Estimated biomass.

The total catches and estimated biomass are provided in Table 10. A total of **624.41 kg** (Table 10) of marine species were caught at bathymetric depths between 21 and 112.0 m. Biomass estimation was not carried out on board the GLC, but at the Fisheries Department in Banjul. The method used to calculate biomass was based on standardized fishing operations which consider sampling of all the individuals captured in the swept area of the trawl gear. Total biomass is estimated at **9,243.08 t** (Table 12).

Table 10. Catches (kg) and estimated biomass (t) by stratum.

Station No.	Strata (m)	Trawling depths (m)	Catches (kg)	Estimated biomass (t)	% catches
59 & 60	101 – 200	98 – 112	51.21	81.46	0.88
58 & 61	051 - 100	75 – 48	426.60	5,571.94	60.28
57 & 62	010 - 050	21 – 26	146.60	3,589.68	38.84
Total			624.41	9,243.08	100

The total density is 2,036.89 kg/km² or 2.04 t/km². Also, the total abundance index is 208.14 kg/hr or 0.208 t / hr.

Table 11. Density and abundance index / stratum.

Stratum (m).	Area covered (km ²)	Density (kg/km ²).	Abundance index (kg/hr)
101 - 200	0.10121	505.98	51.21
051 - 100	0.10267	4,155.06	426.60
010 -050	0.10267	1,427.88	146.60

4.6. Length measurements of the selected fish species.

Length measurement was conducted on ten fish species, the purpose of which was to determine the maximum, minimum and the modal length of each taxon (Table 13). The fish species that length measurement was conducted included eight (8) demersal (*Pagellus bellottii*, *Epinephelus aeneus*, *pomadasys incisus*, *Pseudupeneus prayensis*, *Parapristipoma octolineatum*, *Plectorhynchus mediterraneus*, *Spondyliosoma cantharus* and *Sparus caeruleostictus*) and two small pelagic fish species (*Decapterus rhoncus* and *Trachurus trecae*). The length measurements were based on the total length of the fish species and were each measured on a wooden fish measuring board. A total of 901 individual fish species were measured.

4.7. Description of some selected fish species.

The fish species considered in the length measurements are described below:

4.7.1. *Pagellus bellottii*.

Pagellus bellottii is a fish species of the SPARIDAE family. It was captured at Stations 57, 58, 59, 61 and 62. A total catch of 674 individual species equivalent to 26.25 kg was captured in a 150 min. trawling of 5 x 30 min.

4.7.2. *Epinephelus aeneus*.

Epinephelus aeneus belongs to the SERRANIDAE family. It is considered among the most high value fish species in the list of all captured fish species from the Gambian waters. The fish species was found close to the shores at Stations 61 and 62, at bathymetric depths from 22.0 to 75.0 m. The catch was 7 individuals representing 8.9 kg. The average length is approximately 50.0 cm of the five fish measured at station 61.

4.7.3. *Pomadasys incisus*

Pomadasys incisus belongs to the HAEMULIDAE family. The fish species was found at Stations 58, 59, 61 and 62, at water depths ranging from 22.0 to 112.0 m at the continental shelf. A total of 195 individuals equivalent to 28.98 kg were caught in a 120.0 min. trawling time. A 43 % of the fish species was caught at Station 58, at bathymetric depth between 48.0 and 52.0 m. The average total length of stations 58, 59 and 61 is 21.23 cm. This fish species is highly landed by the Artisanal fishing boats and is commercially important.

4.7.4. *Sparus caeruleostictus*

This fish species belongs to the SPARIDAE family. It was found at Stations 57, 58, 61 and 62, at depths ranging from 21.0 to 75.0 m. A total of 185 individuals representing 81.8 % of the total catch of the species were caught at Station 62 (22.0 – 26.0 m depth). Total catch in 120.0 min. trawling time was 24.82 kg.

4.7.5. *Pseudupeneus prayensis*

This fish species belongs to the MULLIDAE family. The fish species was found at stations 58, 59, 60, 61 and 62 at depth ranges between 22.0 and 112.0 m. A total of 656 individuals equivalent to 142.63 kg were caught in a 150 min. trawling. The average weight is 0.22 kg while average total length is approximately 20 cm.

4.7.6. *Trachurus trecae*

This fish species is a Small Pelagic Fish and was captured at Stations 58, 59, 60, 61 and 62. A total of 579 individuals weighed 45.78 kg were captured. The average weight per fish is 0.08 kg. The catches were clearly juvenile fish species.

Table 13. Maximum, minimum and modal lengths of selected fish species.

Station	Fish species	Nb	Max. – Min. length (cm)	Mode (cm)
57	<i>Decapterus rhonchus</i>	1		
57	<i>Pagellus bellottii</i>	2		
57	<i>Sparus caeruleostictus</i>	20	18.0 - 11.0	12, 13
58	<i>Decapterus rhonchus</i>	15	31 - 24	29
58	<i>Pagellus bellottii</i>	55	25 - 10	15
58	<i>Parapristipoma octolineatum</i>	19	27 - 18	22
58	<i>Plectorhynchus mediterraneus</i>	17	31 - 22	25
58	<i>Pomadasys incisus</i>	28	24 - 19	20
58	<i>Pseudupeneus prayensis</i>	92	25 - 12	22
58	<i>Sparus caeruleostictus</i>	7	28 - 22	22, 26
58	<i>Spondyliosoma cantharus</i>	18	28 - 19	20
58	<i>Trachurus trecae</i>	89	26 - 17	19
59	<i>Pagellus bellottii</i>	90	18.0 - 8.0	10.0
59	<i>Pomadasys incisus</i>	15	25.0 - 21.0	24.0
59	<i>Pseudupeneus prayensis</i>	24	25.0 - 16.0	19.0
59	<i>Trachurus trecae</i>	115	27.0 - 18.0	21.0
60	<i>Pseudupeneus prayensis</i>	18	26.0 - 18.0	24.0
60	<i>Trachurus trecae</i>	15	28.0 - 11.0	21.0
61	<i>Epinephelus aeneus</i>	5	73.0 - 24.0	24, 30, 50, 72, 73,
61	<i>Pagellus bellottii</i>	42	21.0 - 4.0	17.0
61	<i>Pomadasys incisus</i>	16	25.0 - 20.0	22.0
61	<i>Pseudupeneus prayensis</i>	45	26.0 - 13.0	22.0
62.	<i>Pseudupeneus prayensis</i>	70	25.0 - 11.0	14.0
62	<i>Sparus caeruleostictus</i>	83	35.0 - 12.0	14.0

Nb: Max – Maximum length, Min. – Minimum length.

5.0. Conclusions

The survey could be summarized as follows:

1. A total of six (6) trawling stations were conducted in The Gambian waters and all took place on 21st May, 2012.

2. Each of the six trawling lasted for a period of 30.0 minutes.
3. Total catches from the Gambian waters is 624.41 kg
4. Estimated biomass is 9,243.08 tons
5. A total of 5,446 individual species were caught.
6. Average No. of species per station was 908
7. Average surface temperature was 25.5°C
8. Average bottom temperature was 18.8°C
9. Bathymetric depths of trawling area are within 21.0 to 112.0 m.
10. Total coverage area equals to 0.30655 km².

6.0. Gaps

1. Some of the trawl survey data do not reach the Fisheries Department on time which has affected the deadline to submit the report.
2. The proposed survey dates were changed on several occasions and the actual survey dates coincided with the Nansen survey in the region (Guinea – Morocco).
3. The main Focal Point who is the most experienced in terms of fisheries surveys could not participate in the UEMOA Survey due to numerous changes of dates. Instead he participated in the Nansen survey.
4. Biological sampling to determine sex and maturity of the fish species was not carried-out in the Gambian waters compared to the survey in the Guinean and Senegalese waters.
5. The Gambian Scientists did not participate fully because they were inexperienced; it was their first time to participate in a fisheries survey.
6. GLC did not communicate with Port officials prior to their landing at the GPA, Banjul.
7. The Gambian Scientists did not participate in the data entry (form and computer) on board.
8. Guinean Scientists dominated the scientific crew.
9. The environmental data were forwarded late through email on 1st September, 2012, by the Cruise Leader.
10. Printing of the draft copies of the report was a problem at the Fisheries Department.

7.0. Remarks.

Almost all the fish species caught during the UEMOA survey in the waters of The Gambia are threatening. There is a large capacity of traditional fishing boats concentrating on the 0.5 to 5.0 NM (Artisanal) and 8.0 to the 12.0 NM Limits (Industrial). Illegal fishing practices are the main courses of the decline (depletion) of the demersal fish stocks.

8.0. Recommendations.

1. To ensure that any survey, workshop or meeting organized by the UEMOA Project does not coincide with activities of the CCLME.
2. To respect the dates of all planned surveys.
3. A Planning Group of survey activities should be established.

4. Scientists from all the countries in the region should participate in future surveys from beginning to the end.
5. All survey materials, equipment and their functions as well as safety on board should be explained to the local participants prior to commencement of the survey.
6. Limit the fishing capacities (Artisanal and Industrial) in the region.
7. Establish close season at all breeding and spawning grounds.
8. To ensure that all destructive fishing gears are not used in the waters of the region.
9. Implement the Ecosystem Approach to Fisheries (EAF) in the Sub-region for sustainability of the fish resources.
10. Due to the state of the fish stocks, the Fisheries Department in collaboration with The Gambia Marine should enforce the Fisheries Regulations 2008, especially on fishing methods and mesh sizes.

9.0. Acknowledgement.

The Government of The Republic of The Gambia, in collaboration with the Ministry of Fisheries and Water Resources and the Fisheries Department, would like to express their gratitude to the UEMOA / WAEMU Project, for incorporating The Gambia as a non-Member State of the UEMOA to the fisheries component. Special thanks to Mm. Maria Luisa FERREIRA, Directress of Animal Resources & Fisheries, UEMOA.

The Authors would also like to thank Dr. Massal Fall, Dr. Ndiaga Thiam and Mr. Modou Thiam, all of CRODT, Senegal, for their guidance and Technical support in the preparation of this report. Special thanks to Mr. Boran CHHUN, Consultant of this Project, for editing the report as well as providing his tremendous support throughout the process of preparing the report. We also wish to thank the Directorate of the CNSHB, Guinea, for making the GLC Research Vessel available to UEMOA to make the Demersal Trawl Survey a success. The crew of the GLC, the Cruise Leader (Mr. Ibrima Diallo) and support staff are also commended for their support.

10.0. Abbreviations.

CCLME - Canary Current Large Marine Ecosystem.

CNSHB – Centre National des Sciences Halieutiques de Boussoura.

CRODT – Centre de Recherches Océanographiques de Dakar – Thiaroye.

CPU – Catch Per Unit.

FAO – Food & Agriculture Organizations.

FD – Fisheries Department.

GDP – Gross Domestic Products (*PIB* in French).

GMT – Geographical Meridian Time

GPA – Gambia Ports Authority.

IEO – Instituto Espanol de Oceanografia.

Kg/h.- kilogram / hour.

NM – Nautical Miles.

R/O. GLC – General Lansana Conte

UEMOA – Union Economique et Monétaire Ouest Africaine.

UNDP – United Nations Development Programme.

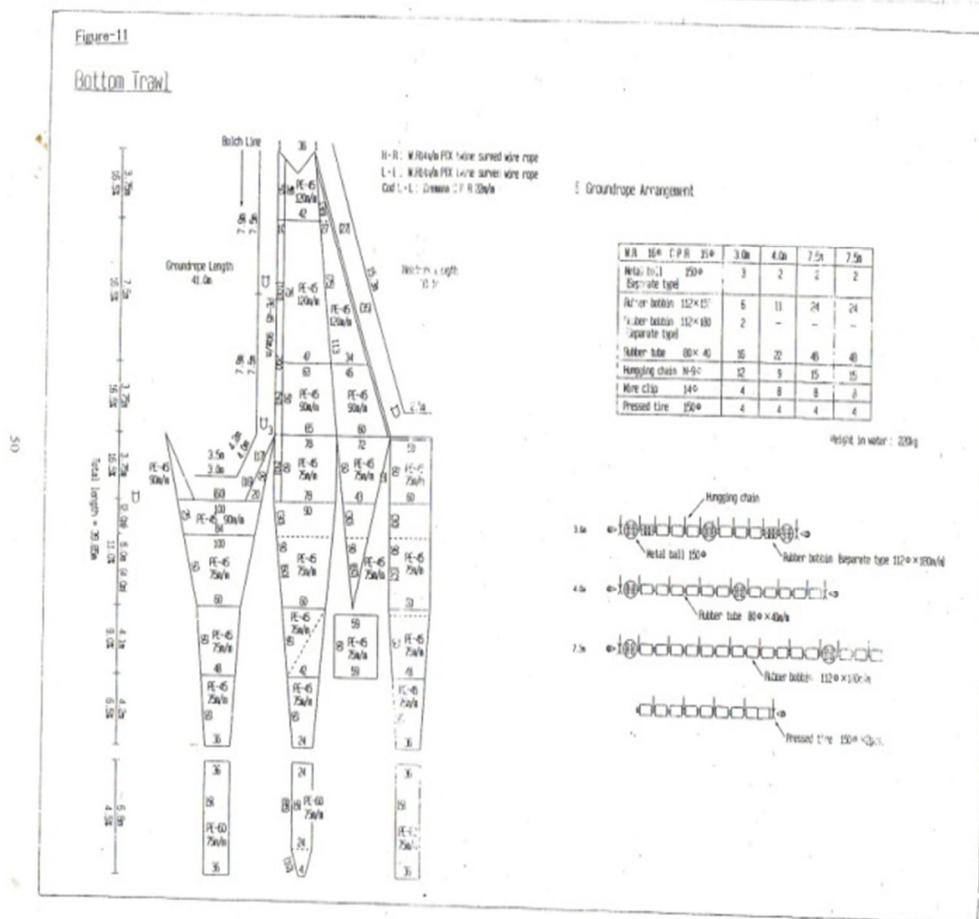

WAEMU – West African Economy and Monetary Union.
